

Meta-harness optimization paths

Ten iterations per line budget. Dots show proposal scores; colored steps show best-so-far validation score.

Shared scale: 0.00-0.35 validation score. Ringed dots are adjusted harnesses carried forward. Crosses are invalid or zero-score candidates.

Adjusted winners: what changed

The useful edits stay close to a Codex compression: execution reliability and completion gating, not task-specific strategy.

Completion integrity guard

1660 LOC · iter 2 cand 2 · val 0.325 (26/80)

Changed If final text follows failed exec/apply_patch, run one status turn before done.

Effect Reduces premature finalization after failed validation or edits.

Portable command shims

1300 LOC · iter 3 cand 1 · val 0.300 (24/80)

Changed Fallbacks for missing rg and python in the existing command sanitizer.

Effect Turns command-not-found dead ends into usable terminal evidence.

Python interpreter shim

700 LOC · iter 7 cand 2 · val 0.312 (25/80)

Changed Bare python/python3 compatibility; prompts and tool schemas stay fixed.

Effect Fixes interpreter mismatch while preserving the compact Codex loop.
